

WHO WE ARE

Meridia Holdings is a technology infrastructure company building a governed financial intelligence platform — not a fintech application. Our architecture deploys an intelligent evaluation and improvement layer across institutional and consumer financial environments, operating beneath existing systems without disrupting them.

The platform is domain-agnostic by design. The same governing architecture that powers consumer financial access also powers institutional compliance intelligence and multi-entity financial governance. Financial data is not a feature of what we build — it is the foundational input that makes everything else precise.

PLATFORM DEPLOYMENT SURFACES

|                                                                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>WayPoint Consumer</b>                                                                                                                                                                                               |
| Multi-tier financial access platform serving individuals across the full spectrum — from excluded and re-entry populations to high-net-worth household governance. Four tiers: Renaissance, Core, Edge, Crown.         |
| <b>Institutional Advisory</b>                                                                                                                                                                                          |
| Financial position intelligence for organizations and entities. Real-time scoring, bilateral risk reading, and differentiated outputs calibrated to board, technical, regulatory, and client audiences simultaneously. |
| <b>Compliance Intelligence</b>                                                                                                                                                                                         |
| CRA-reportable activity tracking, HMDA-aligned community development mapping, and automated compliance documentation for financial institutions operating under regulatory oversight.                                  |

PLAID'S ROLE IN THE ARCHITECTURE

Plaid is the financial data layer that makes the Meridia position engine operational. The relationship is not a single-application integration — it is a platform-level data partnership that scales across multiple institutional deployments and their end users.

The Integra Core engine — Meridia's real-time financial position and trust scoring system — requires live, verified financial data to produce accurate positional intelligence. Plaid's connectivity, verification, and asset documentation capabilities are the inputs the engine is designed to receive.

PRODUCT REQUIREMENTS

|                             |                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Transactions</b>         | Historical and real-time transaction data feeding behavioral analytics and tier-appropriate financial guidance across WayPoint.   |
| <b>Auth</b>                 | Account verification across the onboarding flow, including alternative verification pathways for ChexSystems-flagged populations. |
| <b>Assets</b>               | Verified account history reports usable for underwriting, CRA documentation, and financial position scoring within Integra Core.  |
| <b>Identity</b>             | Bilateral identity verification supporting both client-facing onboarding and institution-facing compliance documentation.         |
| <b>Income + Liabilities</b> | Complete financial position inputs for the FPS engine — full picture of capacity, obligation, and net trajectory.                 |

**Commercial Scope:** Meridia is building infrastructure that deploys across multiple aligned institutions, each with their own connected user populations flowing through the platform architecture. We are interested in understanding Plaid's framework for platform-level partnerships that aggregate volume across multiple deployments.
