

AI-ready education compliance: a documentation automation blueprint

An AI-driven adaptive learning platform can automate or pre-populate the majority of K-5 education compliance documentation — from IEPs and 504 plans to MTSS records and lesson plans — by leveraging continuous assessment data, interoperability standards like OneRoster 1.2 and Ed-Fi, and integration with Georgia's existing GO-IEP and GO-MTSS/SST platforms through Infinite Campus. **57% of special education teachers already used AI for IEP or 504 plan development in 2024–25**, up from 39% the prior year, signaling rapid adoption. (Education Week) Georgia's unique compliance landscape — including a pre-referral intervention mandate, the SST process rooted in the 1984 *Marshall v. Georgia* ruling, (Mymec) (mymec) and state-operated digital platforms — creates both challenges and a well-structured pipeline that AI can accelerate. The practical opportunity is enormous: special education teachers spend more than **10% of their working time** on documentation, (Academia.edu) and classroom teachers report **3+ hours per week** on lesson planning alone, with no existing tool connecting lesson plans to IEP accommodations, progress monitoring data, or adaptive learning session scheduling.

How ILPs and IEPs anchor Georgia's compliance architecture

Individualized Learning Plans in Georgia do not exist as a single, universal K-5 mandate the way states like Rhode Island or Kentucky implement them. Instead, Georgia's ILP-equivalent processes operate in two specific contexts: English Learner ILPs (required for every EL student, reviewed annually, documenting language proficiency levels, ACCESS scores, accommodations, and service models) (Powerschool-docs) and the Student Support Team intervention plans created through Tier 2 and Tier 3 of the MTSS process. Both are managed through **GO-MTSS/SST**, the state's official online platform maintained within the Statewide Longitudinal Data System (SLDS). (Georgia Online IEP +2) The SST intervention plan — Georgia's de facto ILP for struggling learners — contains seven components: Profile, Team Members, Timelines, Meetings, SST data (Gadoe) (developmental history, student data, interventions, progress monitoring, additional supports, and complete review), Contact Log, and uploaded Documents.

ILPs differ from IEPs in fundamental ways that affect automation design. ILPs are governed by state policy with no federal mandate, serve all students (or targeted subgroups), carry no legal enforceability as binding contracts, (Xello) and require less prescriptive team composition. IEPs, by contrast, are legally binding documents under IDEA (n2y +2) (34 CFR §300.320) (Imdsa) with **15+ required sections** including Present Levels of Academic Achievement and Functional Performance (PLAAFP), measurable annual goals, special education and related services with frequency/location/duration, Least Restrictive Environment justification, assessment accommodations, and Prior Written Notice for every proposed or refused action. (Center for Parent Information a...) Georgia adds state-specific requirements through Rules 160-4-7-.05 and -.06: IEPs must be developed within **30 calendar days** (Gwinnett County Public Schools) of eligibility determination, short-term objectives are required only for students taking the Georgia Alternate Assessment, (American Speech-Language-Hea...) and the state's GO-IEP system includes built-in audit checks that must pass before finalization. (Go Solutions)

The documentation burden for IEPs falls disproportionately on writing PLAAFP statements (synthesizing multiple data sources into comprehensive narratives), crafting measurable SMART goals aligned to standards, and managing Prior

Written Notice requirements. ASHA's 2022 survey found speech-language pathologists spend **15.1 hours per week** on indirect tasks including documentation. An AI system with continuous assessment data could draft PLAAFP sections from automatically aggregated performance data, generate standards-aligned SMART goals from baseline metrics, and pre-populate progress reports from ongoing probe data — addressing the three most time-intensive documentation components.

Section 504 plans operate in general education with lighter but critical requirements

Section 504 of the Rehabilitation Act is a federal civil rights law, (n2y) not a special education law, creating a fundamentally different compliance framework from IEPs. (myconnectsuite) (Gae) Eligibility is broader: (Wikipedia) any physical or mental impairment that substantially limits one or more major life activities qualifies a student, (n2y) with no categorical list required. (myconnectsuite) The plan document provides **accommodations for equal access** rather than specialized instruction, (n2y) (Educationalesq) carries no additional federal funding, (National Center for Learning Di...) and technically does not even require a written plan — though the Office for Civil Rights strongly recommends one (myconnectsuite) and Georgia provides nine model forms that districts are expected to follow.

For K-5 students, typical 504 accommodations span environmental adjustments (preferential seating, quiet testing spaces, reduced distractions), instructional presentation modifications (simplified directions, visual aids, audio textbooks, graphic organizers), assignment and assessment adaptations (**extended time**, reduced volume, oral testing options, chunked assignments), behavioral supports (fidget objects, movement breaks, check-in/check-out systems), (Undivided) and health-related provisions (pre-approved nurse visits, snack breaks, medication administration, emergency action plans). Each accommodation must specify the person responsible and the frequency of implementation. (myconnectsuite)

Georgia requires 504 plans to be reviewed **at least annually** with reevaluation every three years. (n2y) (myconnectsuite) The SST often serves as the 504 committee, and 504 plans are maintained as part of the SST file (myconnectsuite) — creating an integrated documentation pathway where GO-MTSS/SST data can support both MTSS interventions and 504 accommodations. The evaluation process requires documented evidence from multiple sources: (PSEA) standardized test scores, psychological assessments, medical diagnoses, academic records, teacher observations, parent input, and discipline records. (myconnectsuite) Critically, the effects of mitigating measures (medication, assistive technology) cannot be considered when determining whether an impairment is substantially limiting. (myconnectsuite)

For AI automation, the 504 opportunity is straightforward: an adaptive learning platform tracking student performance continuously could flag when a student's performance patterns suggest a substantially limiting impairment, pre-populate evaluation documentation with assessment data, and generate accommodation recommendations based on the student's demonstrated learning profile. Since teachers must implement every accommodation — failure constitutes a district-level civil rights violation (myconnectsuite) — automated tracking of accommodation delivery and effectiveness would reduce both compliance risk and teacher burden. (Jotform)

Georgia's three-tiered MTSS framework generates the heaviest documentation load

Georgia's MTSS (GaMTSS) framework integrates academics, behavior, and well-being (Georgiacyber) through five essential components: Screening, Progress Monitoring, Multi-Level Prevention System, Data-Based Decision Making, and Infrastructure (Georgia's unique addition (Cook) encompassing leadership, effective teaming, professional learning,

and family engagement). (Richmond County School System) The documentation requirements intensify dramatically at each tier, and this is where teachers spend the most time on paperwork that AI could most effectively automate.

Tier 1 requires universal screening data for all students (Georgiacyber) three times per year (beginning, middle, and end of year using tools like DIBELS, i-Ready, or MAP), core curriculum fidelity records, differentiated instruction logs, and classroom-level data demonstrating that at least 80% of students meet benchmark. (Georgiacyber) **Tier 2** adds individualized intervention plans specifying the evidence-based program, targeted skills, frequency (3–5 sessions per week, 20–30 minutes each), group size (3–6 students), measurable goals, and the person delivering instruction.

(Georgiacyber) Progress monitoring data must be collected **at least biweekly** (Georgiacyber) — weekly in most Georgia implementations — graphed with aim lines and trend lines, and reviewed by teams every 4–6 weeks. (Branchingminds)

(Ben-hill) Intervention fidelity must be documented separately.

Tier 3 escalates to the formal SST process, (Gwinnett County Public Schools) (Georgiacyber) requiring weekly progress monitoring, SST meetings every six weeks, (Georgiacyber) (Branchingminds) comprehensive student profiles (developmental history, educational records, behavioral records, medical information, social/cultural background), individualized intensive intervention plans with higher frequency (daily sessions, often 1:1 or groups of 3–5, totaling **120–135 minutes per week**), (Branchingminds) and Functional Behavioral Assessments when behavior is a concern. The decision rule framework is data-driven: three consecutive data points below the aim line typically trigger instructional modification, and poor response after fidelity-verified intervention over **8–12 weeks** can trigger referral for special education evaluation.

Georgia's pre-referral intervention mandate under Rule 160-4-7-.03(2)(b) is a **state-specific requirement exceeding federal IDEA**: evidence-based interventions must be provided and documented before initial special education referral, (Georgia Online IEP) with a minimum of 12 weeks if the intervention strategy does not specify a timeframe.

(Georgia Department of Banking...) This creates a critical documentation pipeline. An adaptive learning platform generating continuous performance data could automate the entire Tier 2 and Tier 3 documentation chain: baseline establishment, intervention assignment, weekly progress monitoring data collection, graphing with aim and trend lines, fidelity logging (since the platform itself delivers the intervention consistently), and decision-point analysis. The GO-MTSS/SST platform already feeds directly into GO-IEP at case manager assignment, (Georgia Online IEP) meaning automated MTSS data would cascade into the special education evaluation process without redundant entry. (Georgia Online IEP)

The SST process is Georgia's unique gateway with specific meeting and documentation mandates

Every public school in Georgia must maintain at least one Student Support Team (Forsyth County School District) under State Board Rule 160-4-2-.32, (gadoc) a requirement originating from the *Marshall v. Georgia* (1984) federal consent decree addressing disproportionate placement of minority students in special education. (Mymec) (mymec) The SST functions as an interdisciplinary problem-solving group (Forsyth County School District) (Fultonschools) following a six-step process: identification of learning/behavior problems, (ED School Climate Surveys) assessment, educational plan development, implementation, follow-up and support, and continuous monitoring and evaluation. (gadoc)

SST membership requires the referring teacher plus at least two additional participants (ED School Climate Surveys) from a defined list (principal, general education teacher, counselor, school psychologist, special education teacher, ESOL

teacher, social worker, central office personnel, or Section 504 coordinator). Parents must be invited to all meetings.

(ED School Climate Surveys) Documentation must include student name, team member names, meeting dates, problem identification, assessment records, educational plan with implementation results, and follow-up evaluation. (gadoc) Schools must establish **regular monthly meeting dates**, (Mymec) with Tier 3 cases reviewed every six weeks.

The SST process produces a comprehensive case file in GO-MTSS/SST that documents the entire intervention trajectory. When the team recommends special education referral, this is recorded on the Complete Review Page, and all data — student profile, parent information, assessment data, developmental history, progress monitoring records, and uploaded documents — automatically imports into GO-IEP. (Georgia Online IEP) Interventions discontinued more than six months prior do not transfer. (Georgia Online IEP) (Georgia Online IEP) Georgia also allows SST bypass with "reasonable cause" (e.g., obvious disability), though documentation must justify the bypass and note whether the parent agreed.

(ED School Climate Surveys) (gadoc)

For AI integration, the SST process presents both automation opportunities and constraints. An adaptive platform could pre-populate the developmental history, compile and graph all assessment data, generate intervention summaries with fidelity metrics, and produce data-driven recommendations for team review. However, the collaborative, human judgment elements — team discussion, parent engagement, professional interpretation of data — must remain human-driven. The AI role is to prepare the documentation so thoroughly that SST meetings shift from paperwork review to substantive decision-making.

Progress monitoring tools and lesson plan systems remain disconnected

Georgia K-5 teachers currently navigate a fragmented ecosystem of progress monitoring tools. **DIBELS** (Dynamic Indicators of Basic Early Literacy Skills) provides standardized literacy probes with 20+ alternate forms for frequent reassessment, each taking just minutes to administer. (Reading Rockets) **i-Ready** offers computer-adaptive diagnostic assessment widely used across Georgia for benchmark testing three times per year, with instructional pathway recommendations linked to results. (Georgiacyber) **MAP Growth** (NWEA) provides computer-adaptive achievement and growth measurement (NWEA) using the RIT scale — DeKalb County School District uses MAP for benchmarking and school choice testing. **easyCBM** was developed specifically for RTI/MTSS with free teacher versions available. (Riverside Insights) **FastBridge** combines adaptive assessments with CBM tools at approximately \$7.50 per student annually. (Intensiveintervention) **AIMSweb Plus** provides nationally normed skills-based assessments (Sycsd) with automatic scoring and graphing.

The fundamental problem is that none of these tools communicate with each other or with lesson planning systems. Teachers enter the same student data into GO-MTSS/SST, their progress monitoring platform, their grade book, their lesson planner, Canvas (DeKalb County's LMS), and Infinite Campus. An integrated adaptive learning platform could serve as the single data source feeding all downstream documentation.

DeKalb County School District — Georgia's third-largest system serving over 92,000 students across 138 schools (DeKalb County School District) — requires lesson plans with specific components: learning targets, success criteria, standards alignment to Georgia Standards of Excellence (GSE), daily activities (no more than three per day) with estimated durations, assessment alignment with the DCSD Grading Protocol, and accommodations for IEP/504 students. Plans must be uploaded to VERGE or Google Classroom before the instructional week. (DeKalb) The district

developed its own lesson plan template and curriculum in 2017 and uses Canvas as its learning management system alongside Infinite Campus as its SIS (adopted in April 2014). [Infinite Campus](#)

No mainstream lesson planning tool currently integrates with IEP management systems to auto-populate required accommodations. Teachers must manually reference each student's IEP and 504 plan, then manually type accommodations into lesson plans — creating duplication and risk of omitting required supports. Digital planning tools like Planbook (\$25/year), Common Curriculum (free for individuals, with AI-powered planning), [Common Planner](#), Chalk/Planboard (free basic, \$9/month premium), [Common Sense Education](#) and Kiddom offer standards tagging but treat differentiation and accommodation fields as simple text boxes. An integrated platform could auto-import IEP/504 accommodations to lesson templates, pre-populate differentiation suggestions from current progress monitoring data, embed adaptive learning session blocks into the weekly schedule, and generate standards-aligned activities at multiple complexity levels automatically.

Infinite Campus integration is achievable through established data standards

DeKalb County selected Infinite Campus as its SIS in 2014, supported by K-12 Solutions Group as a local channel partner with Georgia state reporting expertise. IC serves as the district's backbone for parent portal access, grades, attendance, assignments, schedules, and mobile app functionality. [Techs Pro Hub](#) The platform includes a **full built-in Special Education module** with IEP creation and management, [Clark County School District](#) 504 plan editors, MTSS support across six categories, RTI documentation with contact logs, goal monitoring tools, [Milwaukee](#) process alerts for compliance deadlines, and quality assurance reports for identifying missing data and compliance gaps.

[Kentucky Department of Educa...](#)

Three primary integration pathways exist for connecting an adaptive learning platform to Infinite Campus:

OneRoster 1.2 is the go-to standard — IC was the first SIS certified by 1EdTech for both OneRoster and CASE specifications. [Infinite Campus](#) OneRoster enables secure roster sharing (students, teachers, sections, enrollments), grade exchange (assignment scores flowing back to IC), and resource exchange. [Storyblok](#) [PowerSchool](#) It uses OAuth 2.0 authentication. Limitation: OneRoster only accesses roster, results, resources, and enrollment data — it does not expose the full IC database including special education records. [Edlink Community](#)

Ed-Fi provides comprehensive data warehousing capability. IC is a certified Ed-Fi technology partner, enabling districts to push data from IC into Ed-Fi operational data stores for state reporting, analytics, and cross-system data sharing. The Ed-Fi Unifying Data Model is CEDS-aligned and open-source, [PowerSchool](#) backed by API tools and community solutions.

SIF (Schools Interoperability Framework) remains available for legacy integrations but the industry is trending away from it. IC's Digital Learning Partners program certifies third-party applications through 1EdTech, providing real-time roster movement, assignment data pass-back, and grade synchronization. [Infinite Campus](#) [Infinite Campus](#) Fee-for-service custom integrations are available through IC's Technical Services team for specialized requirements beyond standard protocols. [Storyblok](#)

For special education data specifically, third-party SPED systems like SameGoal, EDPlan, and Enrich integrate with IC to pull reporting data on-the-fly. IEPs must be "locked" in IC before data flows into state reporting extracts. Some

districts using external SPED systems create "mock IEPs" in IC to satisfy state reporting requirements (State) — an integration pain point that a well-architected platform could resolve.

Georgia's compliance requirements create a structured but demanding pipeline

Georgia's special education rules span **21 administrative code sections** (160-4-7-.01 through -.21), (Legal Information Institute) with the most operationally significant being Rule -.03 (Child Find, most recently amended April 12, 2023), -.04 (Evaluations), -.05 (Eligibility Determination), and -.06 (IEP). The state's pre-referral intervention mandate is its most notable departure from bare federal IDEA requirements: scientific, research-based, or evidence-based interventions must be documented before initial special education referral, (Georgia Online IEP) with a **12-week minimum** if the intervention strategy does not specify a timeframe. (Georgia Department of Banking...)

Key Georgia-specific timelines that an AI system must track include:

- **60 calendar days** from signed consent to complete evaluation reports (P2pga) (P2pga) (pausing for periods when school is not in session for 5+ consecutive days) (Georgia Online IEP)
- **10 calendar days** (best practice) from evaluation completion to eligibility determination
- **30 calendar days** from eligibility determination to IEP development (Gwinnett County Public Schools)
- **21 school days** to provide IEP copy to parents
- **7 days** written notice before any IEP meeting
- **Annual** IEP review (P2pga) and 504 plan review
- **Triennial** reevaluation (P2pga) for both IEPs and 504 plans (P2pga)
- **6-week** SST meeting cycles at Tier 3
- **Hearing and vision screening** within one calendar year of evaluation completion (Georgia Online IEP)

Georgia operates GO-IEP (based on Maryland's Online IEP system developed by Johns Hopkins University) (Georgia Online IEP) and GO-MTSS/SST as integrated state platforms within the SLDS. (Georgia Online IEP) Districts are not required to use GO-IEP — some use alternatives like GoIDEA (Go Solutions) — but the data integration between GO-MTSS/SST and GO-IEP (Georgia Online IEP) is a significant compliance advantage. (gadoc) House Bill 740 adds a behavioral dimension: MTSS reviews are required before expelling or suspending PreK–3rd grade students for more than five cumulative days. (Ben-hill) (Georgiacyber) Senate Bill 48 (2019) mandates K-3 dyslexia screening linked to RTI processes.

Georgia reports compliance data to the federal government through the State Performance Plan/Annual Performance Report (SPP/APR) and publishes district-level performance on special education indicators (Valdosta Today) through Georgia Insights and the Special Education Public Reports portal. (Georgia Insights)

Where AI automation delivers the highest practical impact

The AI automation opportunity maps directly to where teachers spend the most time on documentation that continuous assessment data could replace or pre-populate. Based on the research, the highest-impact automation targets rank as

follows:

Progress monitoring data collection and reporting is the single largest time sink. Weekly or biweekly probe administration, scoring, graphing, trend analysis, and narrative report generation consume hours per student per intervention cycle. An adaptive learning platform generating continuous performance data eliminates manual probe administration entirely. Every student interaction becomes a data point, with automatic graphing against aim lines and decision-rule analysis. The platform could generate GO-MTSS/SST-ready progress monitoring entries and IEP progress reports simultaneously from the same data stream.

PLAAFP statement drafting requires synthesizing evaluation results, benchmark scores, progress monitoring trends, classroom observations, and teacher/parent input into comprehensive narratives for each area of need. AI can draft these from aggregated assessment data, flagging areas where human input (classroom observations, parent concerns) is still needed. Research shows AI-generated IEP goals for preschool students with autism scored **9.1–10 out of 10** on quality metrics versus **5.5–9.2** for manually written goals. [Government Technology](#)

Lesson plan accommodation integration is currently entirely manual. An automated system could pull each student's IEP and 504 accommodations directly from Infinite Campus or GO-IEP and embed them into daily lesson plan templates, ensuring no accommodation is missed and creating an automatic compliance record of planned implementation.

SST meeting preparation consumes significant administrative time: compiling student data, printing progress monitoring graphs, preparing developmental histories, and generating meeting agendas. An integrated platform could produce complete, data-current SST meeting packets automatically, with all graphs, intervention summaries, and decision-point analyses pre-generated.

Intervention fidelity documentation is uniquely suited to platform automation. When the adaptive learning system itself delivers the intervention, fidelity is inherent — the system delivers the prescribed content at the prescribed frequency for the prescribed duration, logging every session automatically. This eliminates both the fidelity documentation burden and the fidelity concern that currently undermines much intervention data.

Conclusion

The practical blueprint for an AI-driven adaptive learning platform in Georgia's K-5 compliance ecosystem centers on three architectural principles. First, the platform must serve as a **continuous assessment engine** whose data feeds every downstream document — from MTSS progress monitoring entries through SST meeting packets to IEP progress reports and lesson plan accommodations — through a single data collection process rather than parallel manual systems. Second, integration with Infinite Campus through **OneRoster 1.2 for roster and grade data** and **Ed-Fi for comprehensive data exchange** provides the interoperability backbone, while Georgia's GO-MTSS/SST and GO-IEP platforms handle state-specific compliance workflows. Third, FERPA compliance requires PII stripping before AI processing, contractual school official exception agreements, no model training on student data, and comprehensive audit trails [Element451](#) — patterns already established by tools like Paradigm Pioneers and Goalbook Threads.

[Goalbook](#)

The market timing is compelling. Purpose-built AI education compliance tools have moved from novelty to mainstream adoption in under two years, with products like [Education Week](#) Branching Minds (used by Chicago Public Schools for MTSS), [Branchingminds](#) [Branchingminds](#) Goalbook Toolkit (moving districts from 48% to 87%+ inclusion rates), [Goalbook](#) and Playground IEP [Playgroundiep](#) [Progress Learning](#) demonstrating measurable impact. [Playgroundiep](#) Georgia's structured, state-operated platform ecosystem (GO-MTSS/SST → GO-IEP) [Georgia Online IEP](#) and mandatory pre-referral intervention requirement [Mymec](#) create a documentation pipeline that is simultaneously burdensome for teachers and well-suited to automation. The district that would benefit most immediately is one like DeKalb County: large (92,000+ students), diverse (172+ languages), already on Infinite Campus, and managing compliance across 138 schools [DeKalb County School District](#) with the full spectrum of MTSS, SST, IEP, and 504 requirements.
