

Appendix L – The Manus Layer & Wearable / Tokenized Access Concept

From “app you open” to “council that walks through the world with you”

Most of the system so far lives on screens: dashboards, reports, sandboxes, advisor consoles. The Manus layer asks a different question:

“What happens when the OS is not something you log into, but something that quietly walks with you—in your glasses, in your car, in your workspace?”

This appendix captures the conceptual design for a **Manus Layer**: a wearable- and token-based access fabric that takes Sentiarch and WayPoint from “systems you occasionally consult” to “companions and guardians you can lean on in real time.”

L.1 Manus as a layer, not a gadget

Manus is not a brand of smart glasses or a specific piece of hardware. It is a **layer** that can inhabit multiple devices:

- smart glasses (with camera, mic, and bone-conduction audio),
- future contact-lens style interfaces,
- vehicle HUDs,
- desktop workstations in “always-on” mode,
- secure mobile apps with biometric access.

The Manus layer does three things:

1. **Presence** – it is aware of *context* (where you are, what you’re doing) in a safe, privacy-respecting way.
2. **Interpretation** – it can quietly interpret signals from your world (visual, audio, data) and bring the right parts of Sentiarch’s intelligence to bear.
3. **Action** – it can help you take small, immediate actions—confirmations, deferrals, “tell me more later”—without dragging you into a full interface.

Think of it as the “**Kit**” **layer** from the Knight Rider analogy: always there, always watching out for you, never taking the wheel unless you’ve agreed on the rules.

L.2 Wearable experience – “Your council in your ear and in your periphery”

A typical Manus-enabled smart glasses flow might look like this:

1. **Biometric attunement.**

When you put on the glasses, Manus confirms who you are via fingerprint pad, face match, voice print, or a combination. Once confirmed, your **personal council** is live: Sentiarch's orchestrator plus your configured positioning systems (FPS, EPS, APS, etc.) can speak with you as needed.

2. **Passive mode – subtle overlays, no overwhelm.**

Most of the time, Manus behaves like a calm second pilot:

- light, optional overlays in your peripheral view (e.g., “Next bill due in 3 days,” “You’re arriving at a recurring merchant where spending has been trending up”),
- gentle audio pings if a threshold event happens (unusual card charge, major portfolio move, time-sensitive opportunity).

The key design principle: **no constant chatter**. Manus is allowed to interrupt only by rule: high-risk events, actively requested guidance, or scheduled check-ins.

3. **Active mode – “Call X” instead of “Hey device.”**

When you need help, you don't say “Hey Manus” or “Hey Siri.” You call the *personality* you've assigned:

- “Call Marcus” (for your financial orchestrator),
- “Call Ava” (for your education / learning EPS),
- “Call Studio” (for your creative APS).

They respond through the same glasses, already aware of context:

- your current location,
- the last few financial / educational / creative events you engaged in,
- any alerts or tasks pending from your positioning systems.

This makes the experience less like “querying a tool” and more like “pulling a council member into the room.”

4. **In-the-moment assistance.**

Because Manus is live and context-aware, it can provide on-the-fly support:

- At a car dealership: “Before you sign, here are three things your TPS/WPS council thinks you should know about this financing offer.”
- In a store: “This looks like a spontaneous purchase that hits a category you’ve told me you’re tightening; want to log it as an intentional treat, or reconsider?”
- In a negotiation: “You’re discussing terms similar to the ones in this sample contract you reviewed last month; do you want a quick summary of the differences?”

5. **Recording, transcription, and return-to-home.**

With consent, Manus can:

- record key meetings or conversations,
- transcribe them and tie them into your workspaces (tax, legal, creative),
- surface next steps when you sit down at your home or office system.

The goal is that **nothing important is lost** and no future you is forced to say, “I wish I’d written that down.”

L.3 Tokenized access – “The banking token, evolved”

Today, banks use physical cards and soft tokens to prove it’s really you. The Manus layer imagines a **token fabric** that stretches across:

- your wearables,
- your vehicles,
- your home environment,
- your enterprise workspace.

Key ideas:

1. **NFC-based Manus tokens.**

Manus-enabled glasses or devices contain secure NFC elements that can:

- store payment credentials,
- act as keys for vehicles or buildings,
- handshake with other Manus devices (the “chirp” between glasses).

The response to a tap is not just “payment authorized”; it can be “payment authorized, and your FPS council is logging this as part of your ‘Q2 travel budget’ using rules you defined.”

2. **Contextual permissions.**

Different contexts can unlock different capabilities:

- At home office: full financial control, portfolio moves, deep scenario modeling.
- In public spaces: limited actions (confirm small payments, approve pre-set thresholds).
- In a vehicle: hands-free, voice-only interactions limited to non-destructive operations (status checks, reminders, playback of briefings).

3. **AI-governed tokens, human-governed policies.**

Sentiarch can recommend token policies:

- “Given your patterns, we suggest requiring a second factor (phone, spouse confirmation, or time delay) for any move over \$X.”
- “For your heir, we suggest read-only Manus permissions plus sandboxed practice moves.”

But final authority sits with **the human** and, where relevant, with governance bodies (trustees, boards).

L.4 Manus in the enterprise & UHNW worlds

For UHNW families, family offices, and enterprises, Manus is where the **closed network node** idea comes alive:

- A UHNW principal's glasses can be whitelisted to a private airfield, a yacht, or a closed corporate campus.
- When they enter those spaces, Manus automatically shifts into **Crown / FO mode**:
 - pulling up entity-level dashboards in their periphery,
 - providing agenda support for board meetings ("These are the three trust issues you flagged last time"),
 - surfacing stewardship prompts ("Before approving this distribution, here's how it moves the Trust Index").
- For boards and councils, Manus can act as:
 - a silent meeting secretary, transcribing and tagging discussion,
 - a real-time "memory" of past decisions and rationales,
 - a safeguard ("You're about to reverse a policy from 3 years ago; here's why you adopted it then").

In a corporate context:

- Executives and key staff can have Manus-enabled workspaces that treat policies, SOPs, and financial positions as **living substrates** instead of static manuals.
 - Zero-trust access is enforced through biometrics + tokens, making remote work and distributed leadership safer without making it unbearable.
-

L.5 Safety, privacy, and governance of Manus

Because Manus sits closer to the body—and closer to continuous surveillance risk—it must be **over-governed, not under-governed**.

Core principles:

1. **User primacy.**

The wearer always controls:

- what is recorded,
- what is analyzed,
- what is retained.

Always-on recording is **opt-in** and context-specific.

2. **Minimal necessary sensing.**

Manus should not Hoover up everything just because it can. For each feature, Manus must answer: "What is the minimal data we need to provide this value?" and stick to that.

3. **Explicit modes.**

There must be clear, visible states:

- “Recording in progress,”
- “Analysis only,”
- “Ambient alerts only,”
- “Privacy mode” (no sensing, just simple notifications).

4. **Independent oversight hooks.**

For UHNW / enterprise deployments, Manus should be deployable under:

- internal policy review,
- external privacy audit,
- optional regulator review where relevant.

The Manus spec itself becomes a thing that can be **reviewed and certified**.

L.6 Roadmap position – when and how to build Manus

In the overall Sentiarch / WayPoint / Eden Crown roadmap, Manus is **not** an MVP requirement. It sits in:

- **Phase 2–3 for product** (after WayPoint Core / Edge are proven, and Eden Crown FO-OS has at least one real-world implementation).
- **Phase 1 for narrative** (because it signals to UHNW, FO, and enterprise partners that there is a path from today’s dashboards to tomorrow’s embodied OS).

Pragmatically:

- Early Manus prototypes can be **software-only**:
 - mobile apps acting as “light Manus,”
 - desktop “presence” modes,
 - integration with existing smart-glasses platforms for small pilots.
- Hardware integration and bespoke devices can wait until:
 - the value of “council in your ear” is demonstrated,
 - governance patterns are mature,
 - there is a clear cohort (UHNW, FO, executive teams) asking for it.

Manus exists in this document as both a **north star** and a **design constraint**: whenever you make decisions about Sentiarch, WayPoint, or Eden Crown, you can now ask, “How will this behave when it is no longer on a flat screen, but in someone’s field of view and daily life?”
